

## Cold Roll Disclaimer

B & M Metals' cold roll products are produced using raw steel that is not coated with rust inhibitors like our other steel products which causes the material to rust when exposed to humidity and other atmospheric conditions.

As in most other building products that aren't coated with a rust protection or painted, the amount of time it takes as well as the uniformity of the rusting process can vary and is a characteristic of our cold roll products and is not grounds for rejection of the panels or trim.

Factors that affect the rate at which the steel rusts include, but are not limited to, the amount and frequency of moisture that the panels are exposed to and the amount of oil on the steel which is used in the handling process. On occasion when the cold roll steel is made into trim as opposed to panels, the rust process can vary due to the fact that different processes such as roll forming may remove more oil than simple folding processes.

The panels and trim may show signs of edge or surface rust prior to installation. This is a normal occurrence and is not grounds for rejection of the product.

Rust runoff from the panels will likely stain the surrounding surfaces and is not grounds for a claim or rejection of the product.
